

Setup — do this before the workshop

Do these in advance before the workshop day.

Three things are needed: Python with five packages, Claude Code, and this repository.

CONTENTS

1. Python
 2. The repository
 3. The Python packages
 4. Claude Code
 5. Check everything
- If a check fails
- If you cannot fix it before the session

1. Python

You need Python 3.9 or later. Check what you have:

```
python3 --version
```

If that fails or reports an older version:

- **macOS** — install from python.org, or `brew install python` if you use Homebrew.
- **Windows** — install from the Microsoft Store, or from python.org. During installation, tick **Add Python to PATH**. Use `python` instead of `python3` in every command below.
- **Linux** — `sudo apt install python3 python3-pip` on Debian or Ubuntu.

If you already use Anaconda / Miniconda or some sort, that Python is fine.

2. The repository

Download or clone it, then move into the folder:

```
git clone https://github.com/chinhsutran/CoAI-workshop_DataAnalysis.git
```

(The URL will be available 1-week before the workshop)

No git? Download the ZIP from the URL above and unzip it. Everything in the session works from the ZIP except one step in Block 2, where you put your own analysis script under version control. If you can install git from git-scm.com, do it — it takes two minutes and you will use it in that step.

3. The Python packages

From inside the folder:

```
python3 -m pip install -r requirements.txt
```

Five packages: numpy, pandas, scipy, matplotlib, statsmodels. All are standard and none needs a compiler.

4. Claude Code

Install it:

```
npm install -g @anthropic-ai/claude-code
```

This needs Node.js version 18 or later. If `npm` is not found, install Node from nodejs.org first.

Then start it once from inside the repository folder:

```
claude
```

It will ask you to sign in the first time. Follow the prompts, then type `hello`, confirm it replies, and exit with `/exit`.

=> using institution-specific access to sign-in.

5. Check everything

```
python3 selfcheck.py
```

Every line should say PASS. If it does, good to proceed.

If a check fails

python3: command not found

On Windows use `python`. On macOS, if you installed from python.org, open a new terminal window first.

A package fails to install

Try `python3 -m pip install --user -r requirements.txt`. If your institution blocks the package index, that is the most common cause and needs local IT.

claude: command not found after installing

npm installed it somewhere not on your PATH. Run `npm config get prefix`, and add the `bin` folder inside that path to your PATH. Opening a new terminal window resolves this most of the time.

npm: command not found

Node.js is not installed. Install it from nodejs.org and try again.

Claude Code starts but will not sign in

Check whether your network blocks the connection. Try again on a different network.

A warning about numpy and scipy versions

If you see `A NumPy version >=1.23.5 and <2.3.0 is required for this version of SciPy`, the analysis

still runs correctly. It is a version notice, not an error. You can silence it by upgrading scipy.

Something else

Note the exact error text and let us know.

If you cannot fix it before the session

Please let us know or seek help from our clinic CoAIs.

Even if falling behind: Proceed anyway. The checkpoint scripts help catch up results of the session. You will not be left with nothing to do.
